

Bushwalking Pack

This robot pack is designed to be the bushwalker's carrying partner when walking. It is inspired by spiders and their highly manoeuvrable body, but it is instead six-legged as it does not need spare legs for survival. It has a red top to signify the redback spider.

This robot is programmed to follow a bluetooth signal from a small keychain which the user can put in their pocket or keys. The top body of the robot is made of silicone for flexibility and waterproofing, and is hollow for space for the user to put all of their needs for the walk.
